

SoDamContext

SoDamContext — Step-by-Step Beginner Guide 🧑

Written in a “**press this now**” style so that even **first-time** computer/AI users can follow along. (For a short summary, command list, and license, see `README.en.md` in the same folder.)

3 things to know first

1. This tool runs **inside Claude Code**. (Claude Code = a program where you code by chatting with AI in plain language.)
 2. You only need to **install once**. After that, just type commands.
 3. “**Input box**” = the line where you type in Claude Code. In this guide, “type ~ in the input box” means typing there.
-

Step 1 • Check prerequisites (1 min)

Type this in the input box and press Enter:

```
!node --version
```

- If it shows **v18 or higher** (e.g. v20, v22) → you’re ready ✅
 - If you see red text / not found → open a web browser, go to **nodejs.org**, click the green **LTS** button to install, then restart your computer.
-

Step 2 • Install (one line at a time)

Paste these **two lines, one at a time**, pressing Enter after each:

```
/plugin marketplace add sodam-ai/SoDam-Context-Eng
```

```
/plugin install sodam-context
```

- A message like “installed” means success.
 - *(For a direct local-folder install, replace `sodam-ai/SoDam-Context-Eng` on the first line with that folder’s path.)*
-

Step 3 • Restart (important!)

What you just installed appears only after a **restart**. - Type `exit` in the input box and press Enter → **fully close** the window (the X) - Reopen Claude Code (in a terminal, type `claude`)

Check: type just `/` in the input box. If you see `sodam-context-checkup` and `sodam-context-intake` in the list, you’re ready! 🎉

Step 4 • Create your first manual (Intake)

If you don’t have an AI manual (`CLAUDE.md`) yet, let’s make one.

1. Type:

```
/sodam-context-intake
```

2. When asked “which folder?”, give the folder path or answer “**this folder**”.

3. The AI asks easy questions **one at a time**. If stuck, you can answer like this:

Question	You can answer
What project is this?	just practice
What language/tools?	not sure
A must-follow rule?	answer in Korean
Something to never do?	don't put passwords in code

Question	You can answer
Tone?	simple and short

- The AI **shows you the content first** and asks “create it like this?”. → If you like it, answer **yes** and the files are created then. (It never creates before asking.)
- When “Created!” appears, you’re done. If it asks “shall I run a checkup too?”, answer **yes** to also check it.

Step 5 • Check a manual (Checkup)

If you already have a `CLAUDE.md` in a folder:

- Type:

`/sodam-context-checkup`

- When asked “which file?”, give the file path (e.g. `C:\MyFolder\CLAUDE.md`).
- Shortly after, you get a **plain report**:
 - Shown as a **count** like “N problems” (the score is hidden on purpose)
 - Any password/key is shown **masked** (`sk-ant-...REDACTED`) only
 - For more, answer **why?** and it explains the reason.

Step 6 • When you get stuck (don’t panic)

If this happens	Do this
<code>/sodam-context-...</code> isn’t in the list	Redo Step 3 (restart). If still missing, type <code>! claude plugin marketplace update sodamcontext-marketplace</code> , then restart again
Something else responds	Don’t use plain language; use a command starting with <code>/sodam-context-...</code>
It says “node not found”	Go back to Step 1 and install Node.js

If this happens	Do this
It created/edited a file without asking	 Stop and tell someone who can help (it should always ask first)

Step 7 • Safety promises (relax)

-  Passwords/keys: it confirms only that one **exists** (without reading the value) and shows it **masked**.
-  It never **creates or edits** files until you say “**yes**”.
-  It does **not** promise “absolutely safe”. It only catches known patterns, so manage important passwords yourself.

You made it to the end — great job!  For a shorter summary, commands, and license, see `README.en.md`.
